CITATION Please acknowledge use of this application in your work: IS-EPOS. (2019). *Resource Management Applications* [Web applications] . Retrieved from <https://tc.s.ah-epos.eu/>

Step by Step

The application uses GDF files (uploaded from the episode data) as an input and allows the User to convert the GDF data into a set of vectors. From the 'Actions' tab within the GDF file view, the User may select 'Use in Application' option and then choose 'GDF to Vectors converter' to create the application. Once it is created, the User can extract any number of vectors of time and time-correlated attributes of their choice (Figure 1).

Figure 1. Input of GDF to Vectors converter application.

The application generates one file for each chosen property. These files might be used as input files e.g. to the [Time Series Builder](#) application that the User can use as a next.
